

ABSTRACT

5 In a solid multi-piece golf ball comprising a solid
core, a mantle, and a cover, the ratio of the compression of
the mantle to the compression of the solid core is at least
0.98, and the difference in JIS-C hardness between the
surface and the center of the solid core is at least 5.
This construction and combination of features provide the
10 ball with a good feel when hit with various types of golf
clubs and improved distance when struck with a driver.
